Measuring the Performance of an XML-Based Communication Primitive, RICSS, September 22, 2006 – p. 1/15

A Unique Invocation

The London Times asks

"What's Wrong with the World?"

Dear Sirs,

I am.

Sincerely yours, G. K. Chesterton

Measuring the Performance of an XML-Based Communication Primitive, RICSS, September 22, 2006 - p. 2/15

Storage and Communication Primitives

- How does object encoding impact performance?
- Contribution: A benchmarking framework to compare the performance of sockets and XML-RPC

Measuring the Performance of an XML-Based Communication Primitive, RICSS, September 22, 2006 – p. 3/15

Remote Communication and OpenDHT

- Clients can put and get with Sun RPC or XML-RPC
- Does the communication primitive impact performance?
- How do we measure performance and/or correctness?

Measuring the Performance of an XML-Based Communication Primitive, RICSS, September 22, 2006 – p. 4/15

Program Execution with a JVM

→ JVM implementation and configuration impacts performance

Measuring the Performance of an XML-Based Communication Primitive, RICSS, September 22, 2006 - p. 5/15

Micro Benchmarks

Experiment	Sent by client	Received by client
SS	Single primitive	Single primitive
SV	Single primitive	Vector
VS	Vector	Single primitive
VV	Vector	Vector

- Use benchmarks similar to those proposed by Allman et al.
- Implement the benchmarks in the Java language
- ExperimentCampaign framework uses Perl and Mathematica

Measuring the Performance of an XML-Based Communication Primitive, RICSS, September 22, 2006 - p. 6/15

Micro Benchmarks II

Experiment	Sent by client	Received by client
FIND (SS)	Single primitive	Single primitive
FACT (SV)	Single primitive	Vector
GCD (VS)	Vector	Single primitive
REV (VV)	Vector	Vector

- Benchmarks use sockets and Apache XML-RPC
- Benchmarks perform a simple computation on the server
- Configure the client and server to execute on same node

Measuring the Performance of an XML-Based Communication Primitive, RICSS, September 22, 2006 - p. 7/15

Experiment Design

- Select Java 1.5.0, GNU/Linux with kernel 2.6.12, 3 GHz P4, 1
 GB main memory, 1 MB L1 Cache, CPU hyperthreading
- → Use operating system and language-based timers to calculate R(B, P), R_∆(B, P, P'), and R[%]_∆(B, P, P')
- Replace the socket communication primitive with XML-RPC
- Execute ten trials and calculate arithmetic means, standard deviations, and confidence intervals
- → Formulate the null hypothesis as $H_0: \mu_{R(B,P)} = \mu_{R(B,P')}$
- Use the Welch's approximate t-test with $\alpha = .01$

Micro Benchmark I

XML-RPC shows greater response time with more dispersion

Measuring the Performance of an XML-Based Communication Primitive, RICSS, September 22, 2006 – p. 9/15

Micro Benchmark II

→ X-REV exhibits high response time due to string parsing

Measuring the Performance of an XML-Based Communication Primitive, RICSS, September 22, 2006 – p. 10/15

Using Very Large Vectors

size(V)	size(V) (bytes)	R(VV,S) (sec)	R(VV, X) (sec)
5000	80,520	0.298	0.347
10000	161,000	0.598	0.523
50000	927,720	18.784	1.697

- At smaller vector sizes sockets demonstrate slightly better response times
- XML-RPC shows better response time when size(V) = 50000: why?

Measuring the Performance of an XML-Based Communication Primitive, RICSS, September 22, 2006 - p. 11/15

Explanatory Power of GC

size(V)	YGC (count)	YGC (sec)	FGC (count)	FGC (sec)
5000	16	.008	0	0
10000	63	.023	4	.050
50000	1645	.697	663	10.375

size(V)	YGC (count)	YGC (sec)	FGC (count)	FGC (sec)
5000	14	.016	0	0
10000	27	.022	1	.020
50000	123	.695	5	.143

Varying the heap size of socket configuration yields similar results

Measuring the Performance of an XML-Based Communication Primitive, RICSS, September 22, 2006 - p. 12/15

GC Allocation Rate

- → S-VV allocates 710, 374, 184 bytes and X-VV only allocates 54, 101, 312 bytes
- At benchmark termination, S-VV has 4,773,224 bytes and X-VV has 7,234,520 bytes of live objects
- Sockets use char[] and XML-RPC uses java.nio.CharBuffer
- Can we use past GC behavior to predict future program performance?

Measuring the Performance of an XML-Based Communication Primitive, RICSS, September 22, 2006 - p. 13/15

Conclusions

- A suite of micro benchmarks to measure the performance of communication primitives
- A comparison of sockets and XML-RPC that we can extend to other primitives
- Experiments reveal a trade-off in the performance of the two primitives
- Extend the study to new primitives and JVMs
- Focus on remote communication, long running benchmarks, and the measurement of throughput
- What are your suggestions?

Measuring the Performance of an XML-Based Communication Primitive, RICSS, September 22, 2006 - p. 14/15

An Invitation to Participate

I value your comments, suggestions, and participation!
